

The classic sort commands are now able to return a value and can be used also in a function, not only in a program like TI's default versions.

Just enter `sort_a(list)` or `sort_d(list)` instead of `sorta list` or `sortd list`: it is not necessary to store `list` as a variable:

The screenshot shows a TI calculator screen with a menu bar at the top containing F1 Tools, F2 Algebra, F3 Calc, F4 Other, F5 Prgm, and F6 Clean Up. The main display area shows the following commands and their results:

```
■ sort_a({1 -2 0 5 4} ▶  
  {-3 -2 0 1 4 5}  
■ sort_d({1 -2 0 5 4} ▶  
  {5 4 1 0 -2 -3}  
sort_d({1,-2,0,5,4,-3})
```

At the bottom of the screen, the status bar displays "MAIN", "RAD AUTO", "FUNC", and "2/30".

This program has been already used many times without problems. If you finds any bug first assure you to have selected the English language in the mode and not to have translated the code with any program. If the problem persists please let me know.

For a better and faster answer please enclose some screenshot of the bug: entered inputs, expected outputs, error messages, erroneous code line, mode setting... it will help me very much!

My address is paolosilingardi@interfree.it . Thank you very much for your help!
